

# Dominating set

Петухов Дмитрий, 371г., СПбГУ

# MDS

- $G = (V, E)$
- DS is a subset of nodes  $D \subseteq V$  such that for all  $u \in V \setminus D$  there exists a  $v \in D$  for which  $(u, v) \in E$
- MDS is that of dominating set of minimum cardinality (domination number of  $G$  -  $\gamma(G)$ )

# Applications

- network testing
- web graphs
- wireless communication
- graph mining

# Algorithms

- MDS of an  $n$ -vertex graph can be found in time  $O(n \cdot 2^n)$  by inspecting all vertex subsets;
- Fomin, Grandoni & Kratsch (2009) -  $O(1.5137^n)$  and expspace;
- Fomin, Grandoni & Kratsch (2009) -  $O(1.5264^n)$  and polyspace;
- van Rooij, Nederlof & van Dijk (2009) -  $O(1.5048^n)$  time;
- HGA-MDS (Hybrid Genetic Algorithm).
